

# Iron Doped Lithium Niobate

## Product Description

Deltronic Crystal's Iron-Doped Lithium Niobate is one of the most preferred photorefractive materials due to its superior photorefractive properties.

Iron-Doped Lithium Niobate is a ferroelectric crystal with the paraelectric to ferroelectric phase transition around 1143 C°. Boules are electrically poled along the Z-axis to align antiparallel domains of the spontaneous polarization.

Deltronic Crystal regularly grows large diameter boules of iron-doped lithium niobate for photorefractive applications. Lithium niobate is chemically stable at room temperature and is generally non-reactive to most solvents.

## Applications

- Astronomical Filters
- Spectroscopic Filters
- Holographic Applications
- Holographic Data Storage
- Wavelength Division Multiplexing

## Features

- Strong Photovoltaic Effects
- High Electro-optic Coefficients
- High Photorefractive Sensitivity
- High Diffraction Efficiency
- Grown by Czochralski Method
